

ABSTRACT

1
2 A pointing device, such as a remote control, including a multi-bit data sensor
3 configured to receive multi-bit data from a portable data repository. The multi-bit data
4 sensor may include a transducer configured to read a bar code, characters, a magnetic
5 strip or the like, and generate resulting electronic data. In various embodiments the
6 portable data repository is a credit card, smart card or other data card. The pointing
7 device may further include memory for data storage and a logic circuit for processing of
8 stored data. In typical embodiments the remote control is configured to control a video
9 display system.
